# K3TS Intelligent Signal Processor Operation Manual 

Revised August 1997

## Notice:

OMRON products are manufactured for use according to proper procedures by a qualified operator and only for the purposes described in this manual.
The following conventions are used to indicate and classify warnings in this manual. Always heed the information provided with them.

DANGER! Indicates information that, if not heeded, could result in loss of life or serious injury.

Caution Indicates information that, if not heeded, could result in minor injury or damage to the product.

## OMRON Product References

All OMRON products are capitalized in this manual. The word "Unit" is also capitalized when it refers to an OMRON product, regardless of whether or not it appears in the proper name of the product.
The abbreviation "Ch," which appears in some displays and on some OMRON products, often means "word" and is abbreviated "Wd" in documentation in this sense.

The abbreviation "PC" means Programmable Controller and is not used as an abbreviation for anything else.

## Visual Aids

The following headings appear in the left column of the manual to help you locate different types of information.

Note Indicates information of particular interest for efficient and convenient operation of the product.
1, 2, 3... Indicates lists of one sort or another, such as procedures, precautions, etc.

## About this Manual:

Section 1 introduces the basic features of the K3TS Intelligent Signal Processor.
Section 2 identifies all the major features of the front panel and gives a brief description of each function.
Section 3 identifies all the input and output features of the terminals and gives a brief description of each terminal.

Section 4 provides the dimensions and environmental conditions needed for mounting the K3TS Intelligent Signal Processor.
Section 5 briefly describes the sensors that can be connected to the K3TS Intelligent Signal Processor.

Section 6 gives comprehensive descriptions on setting the parameters and the operation of the K3TS Intelligent Signal Processor.
Section 7 describes the K3TS Unit's comparative output response (sampling) times under various settings and operating parameters.
Section 8 illustrates some application examples.
Section 9 provides a troubleshooting guide for possible errors during operation and the corrective actions to be taken.
Appendix A provides a list of standard models and options (special specifications).
Appendix B provides a list of sensor models.
Appendix $\boldsymbol{C}$ provides lists of specifications, ratings, and factory-set parameters.

## SECTION 1 Features

This section deals with the basic features of the K3TS Intelligent Signal Processor. A brief description is given of each major feature.

## Operating Parameters

Prescale Value

Forced Zero (Zero-shift)

Display Refresh Period

## Set Values

Bank Selection With the Intelligent Signal Processor, the set value can be altered without key operation via the selection of an another bank when making a level change. The K3TS has 8 banks; each bank can output HH, H, L, and LL set values.

The set value includes a hysteresis setting to prevent the comparative output status indicators from turning ON/OFF when it should not if the measured value fluctuates in the vicinity of the set value.

With the Set Value LED and Thumbwheel Switches Models, the set values can be checked, or changed in RUN mode. Protection of set values is not possible with the Thumbwheel Switches Models.

The Intelligent Signal Processor outputs a linear voltage or current in proportion to the changes in the measured value.

The K constant is used in operating parameter 1 to convert the outputs of the displacement sensors into actual figures.

The number of process values to be averaged can be selected.
With the TIMING-delay function, the time immediately after the TIMING input is turned ON until the start of pulse counting operation can be set within a range of 0.00 to 1.99 s .

The OFF-delay can be set within a range of 0.00 to 1.99 s .

Maximum/Minimum Values The maximum and minimum of the values measured since power application or RESET signal input up to the present point are retained. When the RESET signal turns ON , both the maximum and minimum values are reset to the present value. Even though the maximum and minimum values are retained in memory, the comparative output and BCD output are output in accordance with changes in the measured value, regardless of the display or even if the RESET signal is OFF, except as controlled by the HOLD input (see next feature).

When the HOLD input is turned ON during RUN mode, measurement stops and the input measured just before the HOLD input turned ON is held. The displayed value, comparative output, BCD data, etc., are also held.

This function is convenient for checking a system to which the Intelligent Signal Processor is connected, especially when some inputs cannot be operated. The Intelligent Signal Processor simulates an input, changing the display and output conditions.

This function allows the measured values, comparative outputs, and linear output range to be set as set values while actual measurement is being carried out. This function is useful for setting parameters while checking the operating status of the Intelligent Signal Processor.

Input Range
Input ranges of 4 to $20 \mathrm{~mA}, 1$ to 5 V , or $\pm 9.999 \mathrm{VDC}$ can be selected.

## SECTION 2

## Front Panel: Nomenclature and Functions

This section gives a general description of the Intelligent Signal Processor's front panel.
2-1 K3TS-SD $\square \square$ B- $\square \square$ (with Set Value LED Display) ..... 6
2-2 K3TS-SD1 $\square \mathrm{D}-\square \square$ (with Thumbwheel Switches) ..... 8

## 2-1 K3TS-SD $\square \square \mathrm{B}-\square \square$ (with Set Value LED Display)

The following diagram identifies the major features found on the K3TS with Set Value LED Display front panel. The table gives a brief description of the function of each front panel feature.

| No. | Name |  | Functions |
| :---: | :---: | :---: | :---: |
| 1 | PV (process value) display |  | Displays the process, maximum, and minimum values. Displays characters indicating the set mode and set values. Displays an error message when an error occurs. |
| 2 | SV (set value) display |  | Displays the set value of a comparative output. In setting mode, displays the set parameter. |
| 3 | Comparative output status indicators | HH | Is lit when HH comparative output status is ON. HH comparative output status turns ON when the measured value exceeds the HH set value. |
|  |  | H | Is lit when H comparative output status is ON . H comparative output status turns ON when the measured value exceeds the H set value. |
|  |  | L | Is lit when L comparative output status is ON. L comparative output status turns ON when the measured value falls below the $L$ set value. |
|  |  | LL | Is lit when LL comparative output status is ON. LL comparative output status turns ON when the measured value falls below the LL set value. |
|  |  | PASS | Is lit when PASS comparative output status is ON. PASS comparative output status turns ON when all HH, H, L, and LL comparative output status are OFF. |
| 4 | PV display status indicators | HOLD | Is lit when HOLD input is ON. By turning ON the HOLD terminal on the rear panel, the hold function can be effected. |
|  |  | TIMING | Is lit when the TIMING input is ON. By turning ON the TIMING terminal on the rear panel, the TIMING hold function can be effected. |
|  |  | Min | Indicates that the value displayed on the PV display is the minimum value. To display the minimum value, use the DATA TEACH Key. |
|  |  | Max | Indicates that the value displayed on the PV display is the maximum value. To display the maximum value, use the DATA TEACH Key. |
|  |  | ZERO | Is lit when ZERO shift status is ON. By turning ON the ZERO terminal on the rear panel, the ZERO shift function can be effected. The ZERO indicator is lit when the display value is shifted if the model has a display shift function. |
| 5 | SV display status indicators |  | Indicates whether the displayed set value on the SV display is HH and LL or H and L . The SV display is lit when the set values are HH and LL and not lit when the set values are H and L . |

| No. | Name |  | Functions |
| :---: | :---: | :---: | :---: |
| 6 | Bank indicators |  | To alter the set value without key operation, select another bank when making a level change. The K3TS has eight banks; each bank can output HH, H, L, and LL set values. The selected bank is displayed in the binary system. |
| 7 | Unit |  | Attach the appropriate label (use the labels supplied as accessories). |
| 8 | Operation Keys | Level Key | Selects the setting mode, in which the setting levels can be changed. For details on the setting levels, refer to 6-1 Before Setting the Parameters. |
|  |  | Display Key | Displays a set value on the SV display. <br> In the setting mode, after a parameter is selected with the Shift Key, the selected setting is enabled or disabled or the set value is written to memory with this key. |
|  |  | 》 Shift Key | Shifts the digit where the set value is to be changed. <br> Selects a parameter at each setting level. <br> For details on the setting parameter, refer to Section 6 Parameter Setting and Operation. |
|  |  |  | Increases the value of the current digit in the set value by one. |
|  |  |  <br> DATA <br> TEACH <br> Key | Selects the process value, possible display shift status (*1), maximum value (*2), or minimum value (*2). <br> *1: Available only if the model incorporates a shift function. <br> *2: Available only when operating parameter 3 is in the normal setting. <br> In the setting mode, effects the teaching function. With this function, the comparison value, scaling value, and linear output range are set by means of actual input. For details on the teaching function, refer to 6-3-2 Special Functions. |

## 2-2 K3TS-SD1 $\square \mathrm{D}-\square \square$ (with Thumbwheel Switches)

The following diagram identifies the major features found on the K3TS with Thumbwheel Switches front panel. The table gives a brief description of the function of each front panel feature.

| No. | Name |  | Functions |
| :---: | :---: | :---: | :---: |
| 1 | $\begin{aligned} & \text { PV (process value) } \\ & \text { display } \end{aligned}$ |  | Displays the process, maximum, and minimum values. Displays characters indicating the set mode and set values. Displays an error message when an error occurs. |
| 2 | Comparative output status indicators | H | Is lit when H comparative output status is ON. H comparative output status turns ON when the measured value exceeds the $H$ set value. |
|  |  | L | Is lit when L comparative output status is ON. L comparative output status turns ON when the measured value falls below the $L$ set value. |
|  |  | PASS | Is lit when PASS comparative output status is ON. PASS comparative output status turns ON when all $\mathrm{HH}, \mathrm{H}, \mathrm{L}$, and LL comparative output status are OFF. |
| 3 | $\begin{array}{\|l} \hline \begin{array}{l} \text { PV display } \\ \text { status } \\ \text { indicators } \end{array} \\ \hline \end{array}$ | HOLD | Is lit when HOLD input is ON. By turning ON the HOLD terminal on the rear panel, the hold function can be effected. |
|  |  | TIMING | Is lit when the TIMING input is ON. By turning ON the TIMING terminal on the rear panel, the TIMING hold function can be effected. |
|  |  | Min | Indicates that the value displayed on the PV display is the minimum value. To display the minimum value, use the DATA TEACH Key. |
|  |  | Max | Indicates that the value displayed on the PV display is the maximum value. To display the maximum value, use the DATA TEACH Key. |
|  |  | ZERO | Is lit when ZERO shift status is ON. By turning ON the ZERO terminal on the rear panel, the ZERO shiff function can be effected. |
| 4 | Thumbwheel switches |  | Set $H$ and $L$ set values. The set values can be changed at any time regardless of the RUN or setting mode. |
| 5 | Unit |  | Attach the appropriate label (use the labels supplied as accessories). |

| No. | Name |  | Functions |
| :---: | :---: | :---: | :---: |
| 6 | Operation Keys |  | Selects the setting mode, in which the set levels can be changed. For details on the set levels, refer to 6-1 Before Setting the Parameters. |
|  |  |  | This key has no function in RUN mode. In the setting mode, after a parameter is selected with the Shift Key, the selected setting is enabled or disabled or the set value is written to memory with this key. |
|  |  |  | Shifts the digit where the set value is to be changed. <br> Selects a parameter at each setting level. <br> For details on the setting parameter, refer to Section 6 Parameter Setting and Operation. |
|  |  | $\begin{array}{\|l\|} \hline \text { 图 } \\ \text { Up Key } \end{array}$ | Increases the value of the current digit in the set value by one. |
|  |  |  | Displays the process, maximum, or minimum value. (Operating parameter 3: Only in the normal setting.) <br> In the setting mode, effects the teaching function. With this function, the set values, prescale values and linear output range are set by means of actual input. For details on the teaching function, refer to 6-3-2 Special Functions. |

## SECTION 3

Terminals: Nomenclature and Functions

This section gives a general description of the K3TS Intelligent Signal Processor's terminals.
3-1 Inputs ..... 12
3-2 Outputs ..... 14

## 3-1 Inputs

The K3TS Intelligent Signal Processor's terminal inputs are described in the following diagram and table. The table identifies each terminal and briefly describes its input function.

## 3-2 Outputs

Depending upon the requirements of the output device, the K3TS Intelligent Signal Processor can use one of the following outputs.

K31-C1: Relay (3 Outputs)

K31-C5: Relay (5 Outputs)

K31-T2: Transistor (PNP Open Collector)

K31-L4, L5, L6: Linear + Transistor*

K31-S5: RS-485 + Transistor*

K31-C2: Relay (5 Outputs)

K31-T1: Transistor (NPN Open Collector)

K31-B4: BCD + Transistor* (NPN Open Collector)

COMMON

K31-S6: RS-422 + Transistor*

D-sub 37P Connectors for BCD output (enclosed)
Plug: $\quad$ XM2A- 3701
Hood: XM2S-3711

D-sub 9P Connectors for RS-422 output (order separately)
Plug: XM2A-0901 or XM4A-0921
Hood: XM2S-0911

* Only with model with special specifications.

## SECTION 4 <br> Mounting

This section provides the dimensions and instructions required for mounting the K3TS Intelligent Signal Processor. Mounting conditions for the Unit are also given.
4-1 Dimensions ..... 16
4-2 Panel Mounting ..... 16

## 4-1 Dimensions

All dimensions are in millimeters.

## 4-2 Panel Mounting

The mounting dimensions of the Intelligent Signal Processor conform to DIN 43700. Recommended panel thickness is 1 to 3.2 mm . Attach the mounting brackets supplied as accessories to the Intelligent Signal Processor from behind and tighten the mounting screws of the brackets to a torque of $5 \mathrm{kgf} \$$ $\mathrm{cm}(0.49 \mathrm{~N} \mathrm{~m}$ ).
Whenever possible, keep the Intelligent Signal Processor horizontal. Do not install the Intelligent Signal Processor where it will be exposed to corrosive gases (especially sulfurized gas and ammonia gas). Do not install the Intelligent Signal Processor where it will be subject to vibration, shock, dust, or high humidity. The ambient temperature of the installation site must be within $-10^{\circ}$ to $55^{\circ} \mathrm{C}$.

Note: Attach mounting bracket before wiring the terminals. When removing the Intelligent Signal Processor, first disconnect the wiring, then remove the mounting bracket.

## SECTION 5 <br> Connectable Sensors

This section gives a brief description on the sensors that can be connected to the K3TS Intelligent Signal Processor.
5-1 Linear Sensors ..... 18
5-2 Timing Sensors ..... 18

## 5-1 Linear Sensors

The K3TS incorporates a current input terminal and a voltage input terminal, thus corresponding to a wide variety of linear sensors.

| Terminal |  |
| :--- | :--- |
| Linear sensor output |  |
| Current input | 4 to 20 mA DC |
| Voltage input | 1 to 5 VDC |
|  | $\pm 9.999 \mathrm{VDC}$ |

Displacement sensors, pressure sensors, and flow sensors with an output range of $\pm 9.999$ VDC can be used as linear sensors.

## 5-2 Timing Sensors

Photoelectric sensors and proximity sensors with the following specifications can be used:

| Residual voltage when sensor is on | 3 V max. |
| :--- | :--- |
| Current leakage when sensor is off | 1.5 mA max. |
| Load current | For smooth switching operation, <br> switching capacity should be at least <br> 20 mA with a load current of no more <br> than 5 mA. |

The TIMING input must be via an open collector.

- Without external power supply -

- With external power supply -

Short-circuit the TIMING and GND terminals for contact input operation.
Note Use an external power supply with a supply voltage of 12 to 24 VDC if the operating voltage of the sensor is other than 12 VDC or if the total power consumption exceeds 80 mA .
Short-circuit the TIMING IN and GND terminals for contact input operation.

## SECTION 6 Parameter Setting and Operation

This section provides instructions for the operation of the K3TS Intelligent Signal Processor. Each operational procedure is described with the aid of tables and diagrams.
6-1 Before Setting the Parameters ..... 20
6-1-1 Level of Setting Mode and Parameters ..... 20
6-1-2 Parameter Setting Procedure ..... 22
6-1-3 List of Parameters for Each Model ..... 22
6-2 Parameter Setting ..... 25
6-2-1 Operating Parameter 1 (2-Input) ..... 25
6-2-2 Operating Parameter 2 (Previous Average Value Comparison) ..... 27
6-2-3 Operating Parameter 3 ..... 29
6-2-4 Input Range ..... 32
6-2-5 Number of Process Values to Average ..... 33
6-2-6 TIMING-delay ..... 35
6-2-7 Parameters for Display ..... 36
6-2-8 Parameters for Output ..... 40
6-3 Operations ..... 49
6-3-1 Operations in RUN Mode ..... 49
6-3-2 Special Functions ..... 55
6-4 Display Shift Function Setting Menu ..... 61

## 6-1 Before Setting the Parameters

## 6-1-1 Level of Setting Mode and Parameters

The Intelligent Signal Processor is used mainly in two modes: the RUN mode and the setting mode. In these two modes, the various parameters of the Intelligent Signal Processor can be set. The setting mode has three levels, in each of which one or more parameters can be used. To set the parameters, therefore, first select the setting mode, then select the level and parameter required, from which the necessary parameters can be set. The following diagram illustrates how this is done.

When setting mode is selected, measurement is stopped. Some parameters may not be displayed (i.e., cannot be selected or set), depending on the operating parameter selected and whether the Model is a Display Model or Output Model. For details, refer to the list of valid parameters by operating parameter see 6-1-3 List of Parameters for Each Model.

During operation, if you are unsure of the present status (such as the level or parameter with which the setting has been made), press the Level Key for one second to go one level lower. Be sure to write the set value again on that level. The following list and accompanying diagrams describe how to set levels in step-by-step fashion.

## Setting Level Diagram

## Setting Procedure

1. Press the Level Key or Level and Up Keys to go to the desired level.
2. Use the Shift Key to find the desired parameter.
3. Press the Display Key to access the parameter.
4. Use the Up or Shift Keys to input the desired value.
5. Leave the level you are in with the Display Key.
6. Return to the beginning with the Level Key or the Level and Up Keys.

## 6-1-2 Parameter Setting Procedure

First, set operating parameters on setting level 3 . Then set an input range on setting level 2 . Some parameters will not be displayed when the parameter is changed for another one during operation. When a new input range is selected during operation, all parameters on setting levels 1 and 2 are reset to initial values.

The setting procedure is as follows:
1, 2, 3... 1. Operating parameter 1 (setting level 3 )
2. Operating parameter 2 (setting level 3 )
3. Operating parameter 3 (setting level 3 )
4. Input range (setting level 2)
5. Other parameters

Parameters other than the operating parameters and the input range can be set in any order.

## 6-1-3 List of Parameters for Each Model

The following tables indicate which parameters are available for each Model.
Set Value LED Display Models: K3TS-SD $\square \square \mathrm{B}-\square \square$

| Level | Parameter |  | Display | Output |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 6－2 Parameter Setting

## 6－2－1 Operating Parameter 1 （2－Input）

Operating parameter 1 can convert outputs into actual figures．Set operating parameter 1 according to the following instructions outlined in the table and the flow diagram：

| Setting |  |
| :---: | :---: |
| A | 月 |
| A＋B | Fb |
| A－B | 朋口 |
| $K-(A+B)$ | － |
| $(1-B / A) \times 100$ | －bir |
| $B / A \times 100$ | 口 if |

If $(1-B / A) \times 100$ or $B / A \times 100$ is selected in the 2 -input operation mode, there is no difference in scaling operation between input $A$ and input $B$ and the decimal point will be always between the two rightmost digits and two leftmost digits. Therefore, the operation result will be displayed in a range between -99.99 and 99.99.

## 6-2-2 Operating Parameter 2 (Previous Average Value Comparison)

When the K3TS is set to on in operating parameter 2, the K3TS detects only values fluctuating rapidly, dismissing slowly fluctuating ones such as values caused by the decentering of a sensing object or the sagging of a belt conveyor.
Concept of Previous Average Value Comparison

| Number of <br> measuring <br> operations | Input value | Displayed value | Compared with present value |
| :--- | :--- | :--- | :--- |
| 1 | $V_{1}$ | $V_{1}-V_{1}=0$ | $C_{1}=V_{1}$ |
| 2 | $V_{2}$ | $V_{2}-C_{1}$ | $C_{2}=1 / 2\left(C_{1}+V_{2}\right)=1 / 2\left(V_{1}+V_{2}\right)$ |
| 3 | $V_{3}$ | $V_{3}-C_{2}$ | $C_{3}=1 / 2\left(C_{2}+V_{3}\right)=1 / 4\left(V_{1}+V_{2}\right)+1 / 2 V_{3}$ |
| 4 | $V_{4}$ | $V_{4}-C_{3}$ | $C_{4}=1 / 2\left(C_{3}+V_{4}\right)=1 / 8\left(V_{1}+V_{2}\right)+1 / 4 V_{3}+1 / 2 V_{4}$ |
| $n$ | $V_{n}$ | $V_{n}-C_{n-1}$ | $1 / 2^{n-1}\left(V_{1}+V_{2}\right)+1 / 2^{n-2}+\ldots+1 / 2 V_{n}$ |

Example of Previous Average Value Comparison when selecting Sampling hold

| Number of measuring <br> operations | Input value | Displayed value | Compared with present <br> value |
| :--- | :--- | :--- | :--- |
| 1 | 4.0 | $4.0-4.0=0$ | 4.0 |
| 2 | 3.0 | $3.0-4.0=-1.0$ | $1 / 2(4.0+3.0)=3.5$ |
| 3 | 4.5 | $4.5-3.5=1.0$ | $1 / 2(3.5+4.5)=4.0$ |
| 4 | 3.0 | $3.0-4.0=-1.0$ | $1 / 2(4.0+3.0)=3.5$ |
| 5 | 8.5 | $8.5-3.5=5.0$ | $1 / 2(3.5+8.5)=6.0$ |

Set operating parameter 2 according to the following instructions outlined in the table and the flow diagram:

| Average comparison | ON | an |
| :--- | :--- | :--- |
|  | OFF | aFF |

## 6-2-3 Operating Parameter 3

## Holding Data (TIMING Input)

## Normal

When the K3TS is set to nor- in on operating parameter 3, the TIMING input is not effective, and the K3TS continues data sampling.

## Sampling Hold

When the K3TS is set to 5DH on operating parameter 3, the K3TS retrieves the data on the rising edge of the TIMING input and holds the data until the rising edge of the next TIMING input signal.

## Maximum Hold

When the K3TS is set to $P[H$ on operating parameter 3, the K3TS continues data sampling while the TIMING input is ON. When the TIMING input is OFF, the K3TS displays the maximum value of the data that has been sampled and holds the value until the next TIMING input signal is OFF.

When the K3TS is set to $5 \square H$ on operating parameter 3, the K3TS continues data sampling while the TIMING input is ON. When the TIMING input is OFF, the K3TS displays the minimum value of the data that has been sampled and holds the value until the next TIMING input signal is OFF.

## Peak-to-Peak Hold

When the K3TS is set to $\mathrm{Pr} H$ on operating parameter 3, the K3TS continues data sampling while the TIMING input is ON. When the TIMING input is OFF, the K3TS displays the peak-to-peak value (the difference between the maximum value and the minimum value) of the data that has been sampled and holds the value until the next TIMING input signal is OFF.

To cancel hold status, the RESET input must be ON.
Set operating parameter 3 according to the following instructions outlined in the table and the flow diagram:

| Settings |  |
| :--- | :--- |
| Normal | narn |
| Sampling HOLD | $5 \square H$ |
| Maximum HOLD | FDH |
| Minimum HOLD | $5 \square H$ |
| Peak-to-peak HOLD | FRDH |

## 6－2－4 Input Range

Set input range according to the following instructions outlined in the table and the flow diagram：

| Setting |  |
| :--- | :--- |
| 4 to 20 mA | $4 \square \mathrm{I}$ |
| 1 to 5 V | 105 |
| $\pm 9.999 \mathrm{~V}$ | 9.999 |

$44-20 \stackrel{\text { 园 }}{\rightarrow}:-5 \xrightarrow{\text { 园 }} 9939 \xrightarrow{\text { 图 }}$

## 6-2-5 Number of Process Values to Average

Set the number of process values to average according to the following tables and flow diagram. The setting range available for averaging is shown below.

| Setting period |  |  |  |
| :---: | :---: | :---: | :---: |
| 1 | ; | 128 | 129 |
| 2 | 2 | 256 | 255 |
| 4 | 4 | 512 | $5: 3$ |
| 8 | 8 | 1024 | 1024 |
| 16 | 15 | 2048 | 20418 |
| 32 | 32 | 4096 | 4195 |
| 64 | 54 | 8192 | -192 |

Given a setting, the time required for sampling is shown below.

| Sampling period |  |  |  |
| :--- | :--- | :--- | :--- |
| 1 | 3.1 ms | 128 | 130 ms |
| 2 | 4.2 ms | 256 | 270 ms |
| 4 | 6.2 ms | 512 | 530 ms |
| 8 | 10 ms | 1024 | 1.1 s |
| 16 | 19 ms | 2048 | 2.1 s |
| 32 | 35 ms | 4096 | 4.2 s |
| 64 | 68 ms | 8192 | 8.4 s |

## 6-2-6 TIMING-delay

The TIMING-delay function is available only when the K3TS is set to 5DH, Pl H , $\mathrm{a}[\mathrm{H}$, or PPD H on operating parameter 3 . With the TIMING-delay function, the time immediately after the TIMING input is turned ON until the start of pulse counting operation can be freely set within a range of 0.00 to 1.99 s . The following diagram illustrates the procedure for TIMING-delay time setting:

Setting range
0.010 to 1.99

## 6-2-7 Parameters for Display

## Prescaling

Set prescaling data to convert an input value into a desired displayed value. Prescaling data can be freely set within a range of -9999 to 9999 .
$X_{2}-Y_{2}$ and $X_{1}-Y_{1}$ must be input ( $X$ : Input value, $Y$ : Corresponding displayed value). When the 2 -input operation mode is selected, the $X$ and $Y$ input values must be values resulting from 2-input operation. $X_{1}$ or $Y_{1}$ can be either larger or smaller than $X_{2}$ or $Y_{2}$. If $X_{1}=X_{2}$, it is assumed that $X_{2}=X_{1}+$ 1.

For example, in the case of adding $A$ and $B$ using two sensors, each of which has an output of 1 to 5 V , input value X should not be set from 2 to 10 V but from 2 to 5 V ( $0 \%$ to $50 \%$ input) for easier scaling. $\mathrm{X}_{2}$ or $\mathrm{X}_{1}$ cannot be be set if the total sum of $X_{2}$ and $X_{1}$ exceeds $\pm 9.999 \mathrm{~V}$ or 99.99 mA .

If $(1-B / A) \times 100$ and $B / A \times 100$ are selected, there will be no difference in scaling between input $A$ and input $B$, and the position of the decimal point will be fixed between the second and third digits (i.e., 00.00). Consequently, the result of operation will be displayed in a range of -99.99 to 99.99.

For the $B / A$ of operating parameter 1 , the operation of $1-(B / A)$ is required. Scaling is possible.

The operation for the scaling result of the actual input value is as follows.
Example in the case of 4 - to $20-\mathrm{mA}$ input:
INA = $20 \mathrm{~mA}, \mathrm{INB}=12 \mathrm{~mA}$
Scaling: $X_{2}=20 \mathrm{~mA}, Y_{2}=100, X_{1}=4 \mathrm{~mA}$, and $Y_{1}=0$
Then INA = 100 and $I N B=50$
Therefore, $B / A \times 100=50 / 100 \times 100=0.5 \times 100=50 \%$

## K Constant

The K constant is used to convert the outputs of the displacement sensors into actual figures. The setting of K constant is available only when the K3TS is set to $\mu$ 阴 on operating parameter 1 .

## Display Refresh Period

The alteration of the display refresh period does not change the sampling range. The comparative outputs and BCD data are updated in synchronization with the sampling range. The display refresh period parameter will not appear when the sampling hold, maximum hold, minimum hold, or peak-topeak hold parameter is set on operating parameter 3.

| Setting |  |
| :--- | :--- |
| Refreshed every 0.1 s | FR5L |
| Refreshed every 1.0 s | $\ddots$ |
| Refreshed every 2.0 s | 2 |
| Refreshed every 3.0 s | 3 |
| Refreshed every 4.0 s | 4 |

## 6-2-8 Parameters for Output

## Set Values

To establish whether the measured values are within a given range or criteria, they are regularly compared with set values. In order to establish set values, follow the instructions outlined in the flow diagram (the example is for the setting of set values on Bank 0). Operate likewise for the setting of set values on Banks 1 to 7 after executing (1) to display [5t] to 7 . The decimal is displayed at the position set in the prescale parameter. Any one of $\mathrm{HH}, \mathrm{H}, \mathrm{L}$, and LL can be larger or smaller than the others. No parameter settings for set values are available for the Thumbwheel Switches Models. Establish set values with the front panel's thumbwheel switches. The values are registered 1.5 s after the values have been set.

| Setting range | 09999 to 9999 |
| :--- | :--- |

## Hysteresis

The established set value includes a hysteresis to prevent the comparative output status from tuning ON/OFF when it should not if the process value (displayed value) fluctuates in the vicinity of the established set value.

| Setting range | 101 to 999 |
| :--- | :--- |

Logically, 0 cannot be set as a hysteresis value. If 0 is set, the K3TS takes the hysteresis value as 1 . If sampling hold, maximum hold, minimum hold, peak-to-peak hold values are set on operating parameter 3 (on setting level 3 ), no hysteresis setting is available.

## OFF-delay

The OFF-delay function is available only when the K3TS is set to marin on operating parameter 3. With the OFF-delay function, the comparative output OFF-delay time can be freely set within a range of 0.00 to 1.99 s . The following diagram illustrates the procedure for setting the OFF-delay time:

| Setting range | 0.01 .9 to 1.99 |
| :--- | :--- |

## Protecting Set Values

With the Set Value LED Display Models, the set values can be changed in the RUN mode. However, this feature can be disabled to protect the set values. In order to protect them, follow the instructions outlined in the flow diagram. Protection of set values is not possible with the Thumbwheel Switches Models. Therefore no parameter settings for set value protection appears.

## Linear Output Range

This setting is only for Models with 4 to $20 \mathrm{~mA}, 1$ to 5 V linear output.

For operating parameters 1 through 3, the Intelligent Signal Processor outputs a linear voltage or current in proportion to the changes in the measured value. In the example above, a displayed value corresponding to the $L_{H}$ maximum output value ( 20 mA or 5 V ) and a displayed value corresponding to the $L_{L}$ minimum output value ( 4 mA or 1 V ) is set.
The decimal is displayed at the position set in the prescale parameter. Note that neither $L_{H}$ nor $L_{L}$ shift if the position of the decimal is changed after $L_{H}$ and $L_{L}$ have been set.

Do not set $L_{L}=L_{H}$; otherwise, it is assumed that $L_{L}+1$ digit $=L_{H}$.
This function is not provided on the $\mathrm{mV} /$ digit Output Models on which regardless of the position of the decimal, 1 mVDC is output per digit displayed. (For example, if the displayed value is 150.0 , the output is 1500 mV .) A linear output range cannot be set with Thumbwheel Switches Models.
In order to set the linear output range, follow the instructions outlined in the flow diagram and operate the Intelligent Signal Processor as follows:

## Communications Unit Number

The communications unit number is an identification number by which the host computer to which the Intelligent Signal Processor is connected identifies the Intelligent Signal Processor. The Thumbwheel Switches Models are not provided with the communications output function; therefore, communications unit number setting is not required. For details, refer to the K3TS Communication Operation Manual.

In order to set the communications unit number, follow the instructions outlined on the flow diagram (after the table) and set within the following range:

| Setting range | 00 to 99 |
| :---: | :---: |

## Baud Rate

The Thumbwheel Switches Models are not provided with a communications output function; therefore, setting of the baud rate is not required. For details, refer to the K3TS Communication Operation Manual.
In order to set the baud rate, follow the instructions outlined in the flow diagram (after the table) and set within the following range:

| Display | Meaning |
| :---: | :---: |
| 3013 | 300 bps |
| 5010 | 600 bps |
| 12010 | 1,200 bps |
| 2400 | 2,400 bps |
| 48001 | 4,800 bps |
| 96001 | 9,600 bps |
| 19.24 | 19.2k bps |
| 38.41' | 38.4 k bps |

## 6-3 Operations

In order to perform operations in RUN mode and other special functions, graphs and flow diagrams are given as explanations.

## 6-3-1 Operations in RUN Mode

## Checking Set Values

The Intelligent Signal Processor allows set values to be checked even in RUN mode. The set values of only the bank selected can be checked.

## Set Value LED Display Models

LL and HH or L and H are always displayed on the SV display.
In order to check the set values on the LED Models, follow the instructions outlined in the flow diagram:

Thumbwheel Switches Models

## Changing Set Values

Set Value LED Display Models

Set values can be changed even in RUN mode. The values, however, cannot be changed when the protect input is ON .

In order to change the set values on the Set Value LED Display Models, follow the instructions outlined on the flow diagram, which shows how to change set value H from 50.0 to 55.0 :

Thumbwheel Switches Models

With the Thumbwheel Switches Models, set values can be changed at any time with the thumbwheel switches. The set values are registered 1.5 sec onds after the values have been set with the thumbwheel switches and the Intelligent Signal Processor operates according to the new set values.

## Retaining, Resetting Maximum/Minimum Values

The following is for when the K3TS is set to 3 nirin on operating parameter 3.
Operate as shown below:
The maximum displayed (process) value and the minimum displayed (process) value recorded since power was applied or the RESET input turned ON are retained. Press DATA/TEACH once to display the maximum value on the PV display; press again to display the minimum value; and press again to display the process value. When the RESET input is turned ON, both the maximum and minimum values are cleared. While the RESET input is ON, " Cl C " is displayed.

While the K3TS is holding the maximum and minimum values, output data such as comparative outputs and BCD data are output according to the process value without being retained.
Both the maximum and minimum values re cleared, when the K3TS goes into the setting mode or when the power is switched off.

## Hold Measured Value

The following is for when the K3TS is set to main.
When the HOLD input is turned ON, measurement stops and the input value measured just before the HOLD input is turned ON is held. The displayed value, comparative outputs, and BCD data are also held while the HOLD input is ON. When the HOLD input is turned OFF, the held data is released.
If power is switched ON while the HOLD input is ON, the reset state is regarded as the input value. "질" is displayed in this case. Make sure the HOLD input is OFF before applying power. The following graph illustrates the effect of this operation.

## Forced Zero (Zero-shift)

With the ZERO input ON (by short-circuiting the ZERO input), the process value can be shifted to zero. This condition is held until the next ZERO input signal is turned ON.

The value is calibrated to zero at the rising edge of the ZERO input.
The ZERO indicator on the front panel is lit.

The K3TS retains the value calibrated to zero even if the K3TS is turned off.
To cancel zero-shift state, change the prescaling value (if the prescaling value should not be changed, go to the prescaling menu to reconfirm the $X_{2}, Y_{2}$, $Y_{1}$ values, and the position of the decimal point using the Display Key and then return to the RUN mode) or the input range. Check that the ZERO indicator is OFF when zero-shift state is canceled.

To input a ZERO input signal from a transistor such as a sensor, use an open collector configuration with a transistor that has a minimum collector current of 5 mA or less.

Difference between K3TS with Forced Zero RAM Specifications and Standard K3TS

The zero-shift value of the K3TS with forced zero RAM specifications will be lost when the K3TS is turned off.

Each time forced zero is turned ON on the standard K3TS, the shifted value will be written to the internal non-volatile memory (EEPROM). The data will not be lost even if the K3TS has a power failure. The EEPROM can be overwritten approximately 100,000 times. For applications in which the forced zero function is used more frequently, please use the K3TS-SD21B- $\square$ with forced zero RAM.

When the process value is shifted to zero on the K3TS with a display shift function, the calibrated value will be set in the display shift menu as the shift value. For example, if a process value of 100 is shifted to zero, 0010 will be displayed as the shift value.

To cancel zero-shift state, change the input range or set the display shift value to 010 , at which time make sure that the ZERO indicator is lit.

> | Each time forced zero is turned ON on |
| :--- |
| the standard K3TS, the shifted value |
| will be written to the internal non-volatile |
| memory (EEPROM). The data will not |
| be lost even if the K3TS has a power |
| failure. The EEPROM can be overwrit- |
| ten approximately 100,000 times. For |

| zero RAM. |

## 6-3-2 Special Functions

The K3TS Intelligent Signal Processor is provided with two special functions: test mode and teaching function.

1. Test function: This function is convenient for checking a system to which the Intelligent Signal Processor is connected, especially when some inputs cannot be operated. The Intelligent Signal Processor simulates the input, changing the display and output conditions.
2. Teaching function: This function allows the measured values to be retrieved and set as comparative outputs and as a linear output range while actual measurement is being carried out. This function is useful for setting parameters while checking the operating status of the Intelligent Signal Processor.

## Test Function

The Intelligent Signal Processor is provided with a test function in which simulated signals can be input. When a simulated input signal is applied, an actual corresponding output signal is issued. Confirm the status of the equipment connected to the output side of the Intelligent Signal Processor.

In order to perform this operation, follow the instructions outlined in the flow diagram:

## Teaching Function

## Set Values

The teaching function of the K3TS can be set only when nar-n is set using operating parameter 3 .

The Intelligent Signal Processor is provided with a teaching function that can set an actual measured value as a set value. The Thumbwheel Switches Models are not provided with this function.

In order to perform this operation, follow the instructions outlined in the flow diagram, which shows how to change set value HH on Bank 0 from to 102:
1017 -> TEACH -> 102

The teaching function of the K3TS can be set only when noroperating parameter 3 . With the teaching function, a prescaling value can be set as a set value. In order to perform this operation, follow the instructions outlined in the flow diagram which show how to change set value $\mathrm{X}_{2}$ from 20.00 to 19.010.

With the teaching function, it is possible to retrieve the actual measured values and set them as a linear output range. The Thumbwheel Switches Models do not incorporate a teaching function.

In order to perform this operation, follow the instructions outlined in the flow diagram which show how to change set value $L_{H}$ from to

## 6-4 Display Shift Function Setting Menu

## Display Shift Setting

The display shift function calibrates the displayed value and shifts the displayed value to any value between -9999 and 9999 for all control operations. If the input value changes, the calibrated value will follow the change by retaining the shift value.

| Shift value setting range | 09999 to 9999 |
| :--- | :--- |

The process value can be shifted in the RUN mode if the shift protect is not turned ON. Refer to the following example to shift the process value.
In this example, the displayed value is changed from 45 to 50 .

Note The K3TS with a thumbwheel switch does not incorporate a display shift function or shift protect function.

## Shift Protect Setting

It is possible to change the shift value of the K3TS in the RUN mode if the K3TS incorporates a display shift function. It is, however, possible to prohibit shift value change with the shift protect function of the K3TS.

Note The K3TS with a thumbwheel switch does not incorporate a display shift function or shift protect function.

## Comparative Output Response Time

This section describes the K3TS Unit's comparative output response (sampling) times under various settings and operating parameters.

[^0]
## 7-1 Sampling and Delay in Comparative Outputs

The sampling time or comparative output response time varies with the setting of the number of process values to be averaged or the operating parameters (2-input or holding data).
The K3TS repeats operation A (input retrieval operation) and B (arithmetic processing and discrimination output operation) as shown in the figure below. While operation $B$ is executed, the comparative output transistor operates.

Arithmetic processing and discrimination output (includ-
ing transistor response time)
Input retrieval (sampling time x number of times process value averaged)
If the comparative output is a relay output, the response time ( C in the figure) of the relay is added to the comparative output response time.

The data processing time and comparative output response time vary with the setting condition of each operating parameter as follows below. They do not vary in operating parameter 2 (average value comparison).
Differences in Data Processing Time in Operating Parameter 1 (2-input)
*n: number of process values to be averaged.

| Operating parameter 1 (2-input) | (input retrieval) | $\mathbf{B}$ (arithmetic processing <br> and determination) | $\mathbf{C}$ (relay response time) |
| :--- | :--- | :--- | :--- |
| $\mathbf{A}$ only | $1.04 \times \mathrm{n}^{*}(\mathrm{~ms})$ | 2.08 ms | 10 ms |
| $\mathbf{A}+\mathbf{B}, \mathbf{A}-\mathbf{B}, \mathrm{K}-\mathbf{( A + B )}$ | $2.08 \times \mathrm{n}^{*}(\mathrm{~ms})$ | 4.16 ms | 10 ms |
| $\mathbf{B} / \mathbf{A} \times \mathbf{1 0 0},(\mathbf{1 - B} / \mathbf{A} \times \mathbf{1 0 0})$ | $2.08 \times \mathrm{n}^{*}(\mathrm{~ms})$ | 5.20 ms | 10 ms |

## Differences in Delay in Comparative Outputs in Operating Parameter 3 (Holding Data)

| Operating parameter 3 <br> (holding data) | Definition of delay | Delay in comparative outputs |
| :--- | :--- | :--- |
| Normal | The time required between output <br> transistor operation and input value <br> change. | Min.: A $+\mathrm{B}(\mathrm{ms})$ <br> Max.: (A +B$) \times 2(\mathrm{~ms})$ |
| Sampling hold | The time required between output <br> transistor operation and timing signal <br> rise. | Min.: $1.04+\mathrm{A}+\mathrm{B}(\mathrm{ms})$ <br> Max.: $2.08+\mathrm{A}+\mathrm{B}(\mathrm{ms})$ |
| Maximum hold, minimum hold,, <br> peak-to-peak hold | The time required between output <br> transistor operation and timing signal <br> fall. | Min.: B (ms) <br> Max.: A $+\mathrm{B}(\mathrm{ms})$ |

## Timing Charts (Examples)

## Example 1

The following timing chart shows the operating timing with the setting specified in the table.

| Operating parameter 1 (2-input) | A only |
| :--- | :--- |
| Operating parameter 3 (holding data) | Normal |
| Number of process values to be averaged | 1 |
| Delay in comparative outputs | 3.12 to 6.24 ms |

|  | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Example 2

The following timing chart shows the operating timing with the setting specified in the table.

| Operating parameter $\mathbf{1}$ (2-input) | $\mathrm{A}+\mathrm{B}$ |
| :--- | :--- |
| Operating parameter 3 (holding data) | Normal |
| Number of process value averaging operations | 1 |
| Delay in comparative outputs | 6.24 to 12.48 ms |

## Example 3

The following timing chart shows the operating timing with the setting specified in the table.

| Operating parameter $\mathbf{1}$ (2-input) | A only |
| :--- | :--- |
| Operating parameter 3 (holding data) | Sampling hold |
| Number of process value averaging operations | 1 |
| Delay in comparative outputs | 4.16 to 5.20 ms |

|  | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## Example 4

The following timing chart shows the operating timing with the setting specified in the table.

| Operating parameter $\mathbf{1}$ (2-input) | A only |
| :--- | :--- |
| Operating parameter 3 (holding data) | Sampling hold |
| Number of process value averaging operations | 8 |
| Delay in comparative outputs | 11.44 to 12.48 ms |

## Example 5

The following timing chart shows the operating timing with the setting specified in the table.

| Operating parameter 1 (2-input) | A only |
| :--- | :--- |
| Operating parameter 3 (holding data) | Maximum hold |
| Number of process value averaging operations | 1 |
| Delay in comparative outputs | 2.08 to 3.12 ms |

| 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 | 1.04 |

## SECTION 8

 Application ExamplesThis section provides 5 application examples of K3TS use.
8-1 Height Measurement/Discrimination of Objects ..... 70
8-2 Measurement of Discs ..... 72
8-3 Measurement of Plate Thickness ..... 74
8-4 Checking Height Differences ..... 76
8-5 Detection of the Protruding Portion of Cylindrical Objects. ..... 78
8-6 Examples for Forced Zero RAM Models ..... 79
8-7 Examples for Display Shift Function Models ..... 80

## 8－1 Height Measurement／Discrimination of Objects

The following operations are possible with K3TS：
－With a synchronous sensor，the sampling hold function makes it possible to display the height of an object and hold its value．
－The eight switchable banks make it possible for the K3TS to measure differ－ ent kinds of objects smoothly．
－With the forced zero function，zero calibration can be done with ease．

## Settings

mm ．）
$H_{H}=1.50$
$H=0.10$
$1=00.10$
L $1=0: 50$
（Adjust according to the object）
Hリ5＝－－－
5CR1：If $X_{2}=20.00, Y_{2}=-4.00$
If $X_{1}=4.00, Y_{1}=4.00$
Proz：（set to on if necessary，after all setting operations have been com－ pleted．）
＂－－－＂indicates parameters that are not displayed．

## Dimensional Check of Molding Parts

The K3TS can be used to check the dimensions of molding components and the height of each component after processing．

Dimensional Check after Mounting Objects

## 8－2 Measurement of Discs

The following operations are possible with K3TS：
－The output signal of the linear sensor varies continuously．The peak－to－peak hold function makes it possible to measure the difference be－ tween the maximum value and minimum value of the signal in order to measure the decentering of disc－shaped objects．
－The measuring operation is carried on while the TIMING input（a push switch in this example）is ON．When the TIMING input is OFF，the K3TS will hold the final result．

## Settings

## Level 3

\text { If } X_{1}=4.00, Y_{1}=4.00
$$

Prozt：（set to on if necessary，after all setting operations have been com－ pleted．）
＂－－－＂indicates parameters that are not displayed．
The decentering of the shafts of objects can be measured．If they are not metal objects，use an optical displacement sensor or a supersonic displace－ ment sensor．

## 8－3 Measurement of Plate Thickness

The following operations are possible with the K3TS：
－Using two displacement sensors，the plate thickness can be measured by setting operating parameter to $\mathrm{K}-(\mathrm{A}+\mathrm{B})$ and by converting the outputs of the displacement sensors into actual figures（the thickness of the plates）．
－With the forced zero function，object thickness can be compared with that of a standard object and the deviation can be measured with ease．

## Settings

（Input the results of operation for X and Y ．）
$\mu 5 E t:$（Set the standard sensor distance in mm．）
Prot：（set to in if necessary，after all setting operations terminate．）
＂－－－＂stands for a parameter that is not displayed．

## 8-4 Checking Height Differences

The following operations are possible with the K3TS:

- Using two displacement sensors, the difference in the level of an object surface can be measured by setting operating parameter to A - B.
- With the forced zero function, the difference in the level of an object surface can be compared with that of a standard object.

## Settings

## Level 3

$H=3.10$
$1=2.90$
U = 2.00
(Adjust according to the object)
H'H5 = ---
5c.f1: If $\mathrm{X}_{2}=0.00, \mathrm{Y}_{2}=0.00$
If $X_{1}=16.00, Y_{1}=8.00$
(Input the results of operation for X and Y .)
Prozt: (set to a п if necessary, after all setting operations have been completed.)
"---" indicates parameters that are not displayed.
This method can be applied to an ordinary dimensional checking operation. By measuring the distance between the upper surface of the object and the belt conveyor, the dimension of the object will be measured accurately even if the belt is not evenly flat.

## Dimensional Check of Molding Parts

## 8－5 Detection of the Protruding Portion of Cylindrical Objects

The deflection of cylindrical objects does not influence the detecting opera－ tion．Therefore the objects can be rolled．
For example，the burr or a protruding part of a rubber roller or a molded ob－ ject can be detected．
The following operations are possible with the K3TS：
－With the previous average comparison value function，only a rapid change in value will be checked，and a slow change in value（such as a change due to the deflection of the cylindrical sensing object）will be dismissed．

If $X_{1}=-9.999, Y_{1}=-9.999$
Prot：（set to an if necessary，after all setting operations have been com－ pleted．）
＂－－－＂indicates parameters that are not displayed．

## 8-6 Examples for Forced Zero RAM Models

In the following applications, the zero value is changed repeatedly for measurement purposes.

## Standard Height Change

Height Difference Measurement of Each Object

## 8-7 Examples for Display Shift Function Models

In the following applications, errors are corrected.

Correction of the Sensor Mounting Position

Correction of Height Measurement Values

Correction of sensor errors caused by object colors, materials, and angles.

## SECTION 9 <br> Troubleshooting

If an error message appears while using the K3TS Intelligent Signal Processor, the problem may originate from either the incorrect use of the Intelligent Signal Processor or from external sources such as a faulty sensor. This troubleshooting section suggests some possible sources of error and the corrective actions to be taken.

Troubleshooting Guide
82

## Troubleshooting Guide

The following table shows possible errors during the K3TS Intelligent Signal Processor operation and corrective actions to be taken.

| Item | Condition | Error message | Output status |  |  |  | Corrective action |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Comparative outputs | BCD output | Linear output | Communications |  |
| Device failure | CPU RAM error, external memory error, memory data error. | Erar | OFF | OFF | OFF | OFF | Turn the power OFF and then ON again once. If the error persists, contact OMRON. |
|  | Corrupted data. | [5L5 | OFF | OFF | OFF | OFF | Turn the power OFF and then ON again once. If the error persists, press the mode key and set all parameters again. |
| Sensor failure | Disconnection or short-circuiting of sensor A. | - | OFF | OFF | OFF | OFF | Check for disconnection, short-circuiting, or wiring of sensor A and repair if necessary. |
|  | Disconnection or short-circuiting of sensor B. | 70.6 | OFF | OFF | OFF | OFF | Check for disconnection, short-circuiting, or wiring of sensor B and repair if necessary. |
| Reset | Reset the K3TS. | पडाप | OFF | OFF | OFF | OFF | Check the RESET input. If the K3TS is set to TIMING HOLD state, check the TIMING input. |
| Overflow, underflow | Input value or display value outside range. | $\begin{array}{\|l\|} 9999 \\ \text { Blinks } \end{array}$ | Continues | Continues OVER ON | Continues | Continues OVER ON | Keep the input value and display value within the range. |
| Output type change | When output type has changed. | [二口) | OFF | OFF | OFF | OFF | Check the output type. If correct, press the mode key. At this time, the parameters are initialized; therefore, set the parameters again. If the error persists, contact OMRON. |
| Output type error | Output type other than specified. | Er-Da | OFF | OFF | OFF | OFF | Turn the power OFF and then ON again once. If the error persists, contact OMRON. |

## Appendix A <br> Standard Models

The K3TS Intelligent Signal Processor is suited to essentially any application. The following lists the standard models available:

1, 2: Input Sensors Codes
SD: DC voltage/current inputs
3: Series number
1: Standard Specifications
2: Forced zero RAM
3: Display shift function

4: Power supply voltage
1: 100 to 240 VAC
2: 12 to 24 VDC
5: Type of display
B: Set value LED display
D: Thumbwheel switches (See note 4)
6, 7: Output Type Codes
C1: 3 comparative relay contact outputs (See note 1)
(H, PASS, L: SPDT)
C2: 5 comparative relay contact outputs (See note 2)
(HH, H, L, LL: SPST-NO; PASS: SPDT)
C5: 5 comparative relay contact outputs (See note 2)
(HH, H, L, LL: SPST-NC; PASS: SPDT)
T1: 5 transistor outputs (See note 3)
(NPN open collector)
T2: 5 transistor outputs (See note 3)
(PNP open collector)
Note 1. Thumbwheel Switches Models only.
2. Set Value LED Display Models only.
3. Thumbwheel switches models have the following transistor outputs only: $\mathrm{H}, \mathrm{PASS}$, and L .
4. Thumbwheel switches models have standard specifications only.

## Optional Output Types

Processors with the following outputs are also available:

| Set <br> value <br> LED <br> display | Thumb- <br> wheel <br> switches | Option output type codes/output configuration |
| :--- | :--- | :--- |
| Yes | Yes | B4: BCD output + 5 transistor outputs (NPN open collector) (See note) |
| Yes | --- | L4: 4 to $20 \mathrm{~mA}+5$ transistor outputs (NPN open collector) |
| Yes | --- | L5: 1 to $5 \mathrm{~V}+5$ transistor outputs (NPN open collector) |
| Yes | --- | L6: mV/digit + 5 transistor outputs (NPN open collector) |
| Yes | --- | S5: RS-485 + 5 transistor outputs (NPN open collector) |
| Yes | --- | S6: RS-422 + 5 transistor outputs (NPN open collector) |

Note
Thumbwheel Switches Models have the following transistor outputs only: H, PASS, and L.

## Appendix B <br> Sensor Models

The following lists the applicable sensor models that can be used with the K3TS Intelligent Signal Processor along with the K3TS factory-set parameters associated with the use of these sensors. Examples of prescaling settings are also given.

## Applicable Sensors

The following list provides some typical examples of connectable OMRON Sensors. For further details, please refer to the OMRON sensor catalog.

## Linear Sensors

Sold separately.

## Displacement Sensors

| Sensor | Model | in | $5[81$ |  |  |  |  | 5LGL description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | $\mathrm{X}_{1}$ | $\mathrm{Y}_{1}$ | $\mathrm{X}_{2}$ | $\mathrm{Y}_{2}$ | Decimal |  |
| LED displacement sensor | Z4W-V25R | 420 | 51510 | E 110 | 2001 | 29010 | 00.00 | 21 to 29 mm ( $25 \pm 4 \mathrm{~mm}$ ) |
| Laser displacement sensor | Z4W-A2 | 4200 | 240 | 45010 | 2000 | 5500 | 00.00 | $\begin{aligned} & 45 \text { to } 55 \mathrm{~mm} \\ & (50 \pm 5 \mathrm{~mm}) \end{aligned}$ |
| Laser displacement meters | 3Z4M-J1001- $\square$ | 4200 | 24010 | 3010 | 2010 | 5000 | 00.00 | 30 to 50 mm ( $40 \pm 10 \mathrm{~mm}$ ) |
|  | $\begin{aligned} & \text { 3Z4M-J2001- } \\ & \text { (See note) } \end{aligned}$ | 9999 | 75000 | 35010 | 5010 | 4500 | 00.00 | 30 to 50 mm ( $40 \pm 10 \mathrm{~mm}$ ) |
|  | 3Z4M-J1222-■ | 4520 | 24010 | 7010 | 20010 | 13010 | 000.0 | 70 to 130 mm ( $100 \pm 30 \mathrm{~mm}$ ) |
|  | $\begin{array}{\|l} \hline \text { 3Z4M-J2222- } \square \\ \text { (See note) } \end{array}$ | 9999 | 05000 | 85010 | 5000 | $1: 50$ | 000.0 | 70 to 130 mm ( $100 \pm 30 \mathrm{~mm}$ ) |
| Laser displacement sensors | Z4M-W40 | 9999 | -41010 | 30010 | 4010 | 5000 | 00.00 | 30 to 50 mm ( $40 \pm 10 \mathrm{~mm}$ ) |
|  | Z4M-W100 | 9999 | -41010 | 06010 | 4010 | 14010 | 000.0 | 60 to 140 mm ( $100 \pm 40 \mathrm{~mm}$ ) |
| Parallel-beam linear sensor | Z4LA-1030 | i5 | 10100 | 10101 | 5000 | 0000 | 00.00 | 0 to 10 mm (sensing width) |
| Ultrasonic displacement sensors | E4DA-LS E4DA-WL1C (See note) | 4200 | 24010 | 30010 | 2010 | 70010 | 00.00 | 30 to 70 mm ( $50 \pm 20 \mathrm{~mm}$ ) |

Note The maximum output range of the $3 Z 4 \mathrm{M}-\mathrm{J} 2$ is $\pm 10 \mathrm{~V}$. However, since the input range for K3TS scaling is $\pm 9.999 \mathrm{~V}$, the output range of the $3 Z 4 \mathrm{M}-\mathrm{J} 2$ is set to $\pm 5.000 \mathrm{~V}$ ( $50 \%$ output). Yet there is no scaling error, even if the output range exceeds $50 \%$.

## Appendix C <br> Specifications

## Specifications and Ratings

The following lists the ratings and characteristics of the K3TS Intelligent Signal Processor:

## Ratings

| Supply voltage | 100 to 240 VAC ( $50 / 60 \mathrm{~Hz}$ ); 12 to 24 VDC |
| :---: | :---: |
| Operating voltage range | $85 \%$ to $110 \%$ of supply voltage |
| Power consumption | 15 VA max. (max. AC load); 10 W max. (max. DC load) |
| Insulation resistance | 10 MW min. (at 500 VDC ) between external terminal and case |
| Dielectric withstand voltage | 2,000 VAC min. for 1 min between external terminal and case |
| Noise immunity | $+1,500 \mathrm{~V}$ on power supply terminals in normal or common mode $+1 \mathrm{~ms}, 100 \mathrm{~ns}$ for square-wave noise with 1-ns rise |
| Vibration resistance | Malfunction: <br> 10 to $55 \mathrm{~Hz}, 0.5-\mathrm{mm}$ for 10 min each in $\mathrm{X}, \mathrm{Y}$, and Z directions Destruction: 10 to $55 \mathrm{~Hz}, 0.75-\mathrm{mm}$ for 2 hrs each in $\mathrm{X}, \mathrm{Y}$, and Z directions |
| Shock resistance | Malfunction: $100 \mathrm{~m} / \mathrm{s}^{2}$ (approx. 10G) for 3 times each in $\mathrm{X}, \mathrm{Y}$, and $Z$ directions Destruction: $300 \mathrm{~m} / \mathrm{s}^{2}$ (approx. 30G) for 3 times each in $\mathrm{X}, \mathrm{Y}$, and Z directions |
| Ambient temperature | Operating: $-10 \%$ to $55 \%$ C (with no icing) Storage: $\quad-20 \%$ to $65 \% \mathrm{C}$ (with no icing) |
| Ambient humidity | Operating: 35\% to 85\% (with no condensation) |
| Ambient atmosphere | Must be free of corrosive gas |

## Characteristics

| Input signal | DC voltage/current (4 to 20 mA , 1 to $5 \mathrm{~V},+9.999 \mathrm{~V}$ ) 2 channels |
| :---: | :---: |
| A/D conversion method | Sequential conversion system |
| Sampling time | 1.04 ms |
| Display refresh period | 0.1/1.0/2.0/3.0/4.0 s (switch selectable) |
| Max. displayed digits | 4 digits (+9999) |
| Display | 7-segment LED |
| Polarity display | "-" is displayed automatically with a negative input signal. |
| Zero display | Leading zeroes are not displayed |
| Scaling function | Programmable with front-panel key inputs (range of display: +9999 with a decimal position of $10^{-1}$ to $10^{-3}$ ) |
| Display shift function | With front key input in a range between -9999 and 9999, applicable to models incorporating a display shift function. |
| 2-input operation function | $A, A+B, A-B, K-(A+B),(1-B / A) \times 100, B / A \times 100$ |
| HOLD function | Sampling hold (The data at the rising edge of the TIMING input is held.) Maximum hold (The maximum data while TIMING input is ON is held.) Minimum hold (The minimum data while TIMING input is ON is held.) Peak-to-peak hold (The difference between the maximum value and the minimum value of the data while TIMING input is ON is held.) |
| External controls | TIMING: (TIMING input) <br> HOLD: (Process value held) <br> RESET: (Maximum/minimum data reset, measurement reset) <br> ZERO: (Forced zero) <br> BANK: (Selection of one bank out of 8 banks of set values) |
| Comparative output hysteresis setting | Programmable with front-panel key inputs (001 to 999 digits). |
| Timing delay | 1.99 s max. |
| Output OFF delay | 1.99 s max. |
| Other functions | Set values protect, average value comparison mode, setting of number of process values to average ( $1,2,4,8,16,32,64,128,256,512,1024,2048,4096,8192$ ) |
| Output configuration | Relay contact outputs (5 or 3 outputs), Transistor outputs (NPN open collector) (BCD, linear, and communications models are available by special order) |
| Delay in comparative outputs | Normal parameter: 6.24 ms Sampling HOLD parameter: 5.20 ms |
| Enclosure rating | Front panel: IEC IP50 Rear case: IEC IP20 Terminals: IEC IPOO |
| Memory protection | Non-volatile memory (EEPROM) |

## Measuring Ranges

| Input range | Measuring <br> range | Input impedance | Reliability (at 25\%+5\%C) | Instantaneous <br> overload |
| :--- | :--- | :--- | :--- | :--- |
| $\mathbf{4}$ to $\mathbf{2 0}$ | 2.40 to 26.00 mA | 10 W | 1 1-ch. input: $+0.1 \% \mathrm{FS}+1$ digit <br> max. <br> 2-ch input: $+0.2 \% \mathrm{FS}+1$ digit <br> max. | +200 mA |
| $\mathbf{1}$ to $\mathbf{5}$ | 0.600 to 6.500 V | 1 MW | +200 V |  |
| 9.999 | +9.999 V | 1 MW |  | +200 V |

List of Factory－set Parameters

| Setting level | Parameter |  | Displayed characters |  | Initial value |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Level 1 | Set value |  | ［5ta to 7 | HH | 9999 |
|  |  |  | H | 9999 |
|  |  |  | L | 09999 |
|  |  |  | LL | 09999 |
|  | Hysteresis |  |  | Hリ5 | －－－ | ก10 |
|  | Prescaling |  |  | 5 CRIL | $\mathrm{X}_{2}$ | 2000 |
|  |  |  | $\mathrm{Y}_{2}$ |  | 200 |
|  |  |  | $\mathrm{X}_{1}$ |  | 410 |
|  |  |  | $\mathrm{Y}_{1}$ |  | 410 |
|  |  |  | Decimal |  | 01010 |
|  | Display shift | Shift value |  | －n－75 | －－－ | 01000 |
|  |  | Shift protect | Pr－05 | －－－ | FFF |
|  | K constant |  | H5EL | －－－ | 01010 |
|  | Linear output range |  | LSEL | LH | 5999 |
|  |  |  | LL | प9999 |
|  | Set value protect |  |  | Prot | －－－ | IFF |
| Level 2 | Input range |  | －n | －－－ | 4 CO |
|  | Display refresh period |  | dicp | －－－ | FFSL |
|  | Process values averaging |  | RuE | －－ | $\square$ |
|  | TIMING－delay |  | tロa＇ | －－－ | 0.00 |
|  | OFF－delay |  | arba＇ | －－ | 0.00 |
|  | Unit no． |  | Una | －－－ | 00 |
|  | Baud rate |  | bis | －－－ | 9600 |
| Level 3 | Operating parameter 1 |  | FLin i | －－－ | 8 |
|  | Operating parameter 2 |  | Flinc＇ | －－ | arF |
|  | Operating parameter 3 |  | F！in | －－－ | пロース |

## Revision History

A manual revision code appears as a suffix to the catalog number on the front cover of the manual.
Cat. No. Z79-E1-2A

> Revision code

The following table outlines the changes made to the manual during each revision. Page numbers refer to the previous version.

| Revision code | Date | Revised content |
| :---: | :---: | :---: |
| 1 | October 1991 | Original production |
| 1A | June 1992 | Page 67: Z4W-VS changed to Z4W-V and KSET $=20.00$ changed to $\mathrm{KSET}=$ 70.00 in the bottom diagram. <br> Page 82: The information in "Delay in comparative inputs" of the Characteristics table has been replaced. |
| 1B | November 1992 | Page 18: Information about short-circuiting terminals has been added after the diagrams in 5-2 Timing Sensors. |
| 2 | October 1993 | Page 6: Information added to PV display status indicator row in table. <br> Page 7: DATA TEACH key row corrected. <br> Page 12: INB- corrected to INB+ for the terminal configuration. Open collector configuration for the common input terminals corrected. <br> Page 13: Circuit diagram in table corrected. <br> Page 18: Information added after the note. <br> Page 20: Setting level 1 column in diagram corrected. <br> Pages 22 to 24: Model numbers added to table. Prescale value row added to table. <br> Page 24: Prescale value row in table corrected. <br> Page 26: Information added after graphic. <br> Page 36: Information added after second paragraph. <br> Page 37: Decimal points in display graphic added. <br> Pages 53, 54: Forced Zero operation information corrected. <br> Pages 57, 59: First sentence was rewritten. <br> Page 59: Decimal point in display graphic added. <br> Page 61,62: New subsection added. <br> Page 63 to 67: New section added. <br> Page 70: Last sentence rewritten. <br> Page 70: Level 2 data corrected. <br> Page 71: Application examples added. <br> Page 75: Series number information corrected. Note 4 added. <br> Pages 77, 78: Sensor models added to the lists. <br> Page 82: Sampling period changed to sampling time and data for it corrected. <br> Page 83: Display shift rows added. <br> Page 85: Table replaced. <br> Page 87: Information corrected in table. <br> Page 90: Display shift function row added. |
| 2A | August 1997 | Page 54: Paragraph added to Difference between K3TS with Forced Zero RAM Specifications and Standard K3TS. |
